EXECUTIVE SUMMARY

The EAC region is frequently affected by food shortages and pockets of hunger although the region as a whole has a huge potential and capacity to produce enough food for regional consumption and a large surplus for export to the world market. There are many factors leading to this state of affairs but the most critical are: (i) inadequate food exchange/trade between times and/or places of abundant harvest on one hand, and those with deficit on the other; and (ii) high variability in production caused by high variability of weather which is becoming worse due to climate change.

Hence, the East African Community Food Security Action Plan has been developed to address food insecurity in the region. It forms the initial step of implementing the provisions of the EAC Treaty as set out in Chapter 18 Articles 105 -110.

One of the main objectives of the EAC as set out in the Treaty is the achievement of food security and rational agricultural production. The EAC-Food Security Action Plan will guide coordination and implementation of the joint programmes and projects emanating from this plan.

The Action Plan is organised into four sections. Section one contains the introduction which highlights the background to the development of the EAC food security action plan and the constraints in achieving food security in the EAC. Section two describes the contexts for the EAC food security action plan. Section three provides for the priority areas for the EAC food security action plan while Section four provides detailed action plans which include implementation and coordination arrangements, monitoring and evaluation and resource mobilization for implementation of the Plan.

The Plan shall be implemented over a period of 5 years, from 2010 to 2015 and the Sectoral Council of Ministers Responsible for Agriculture and Food Security will guide its implementation. For its effective and efficient implementation, it will be necessary to strengthen the capacity of the EAC Secretariat to coordinate the implementation of the joint programmes and projects emanating from this plan.

The EAC Secretariat in collaboration with Partner States will draw up a detailed annual work plan indicating financial requirements based on objectives identified in the Action Plan. The implementation of the plan will be phased starting with the crucial strategic interventions. The plans will be financed by the Community, Development Partners and investors.
DEFINITION OF TERMS

Agriculture – In this document is taken to mean crop production, livestock production, fisheries and forestry.

Food Security – Food security exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life, FAO World Food Summit, 1996, Rome.

Off Farm Employment – This means non-farming income generation activities.

1. INTRODUCTION

1.1 Background to the Development of EAC Food Security Action Plan

The overall objective of the EAC Treaty regarding cooperation in agriculture and rural development is the achievement of food security and rational agricultural production. Further, the EAC Agriculture and Rural Development Policy (EAC ARDP) aims at attaining food security through increased agricultural production, processing, storage and marketing.

The EAC ARDP guides the development of strategies and programmes and projects for realisation of the above goals of the EAC. This action plan has been developed to guide the implementation and actualization of a regional food security objective.

In this connection EAC Head of States directed that the EAC Food Security Action plan and EAC Climate Change Policy be developed to address food insecurity and adverse effects of climate change in the region.

1.2 Constraints in Achieving Food Security in the EAC

Although, food security plays an important role in achieving regional development objectives, it is constrained by;

a) Low and unstable production and productivity occasioned by over-reliance on rain-fed agricultural production systems.

b) Low surface water storage per capita in the EAC region.

c) Inefficient utilization of water resources for production including for irrigated agriculture.

d) Poor or no access to affordable agricultural credit by resource poor producers.

e) Low producer prices making agriculture less remunerative.

f) Uncertainty in income flows due to price volatility in agricultural commodities.

g) Inadequate and weak farmer's institutions incapable of supporting a vibrant agricultural sector.
h) Inadequate infrastructure such as transport, communications, storage and processing facilities etc that hinders access to factor and product markets within, between Partner States and beyond.

i) Low usage of agriculture production enhancing inputs such as fertilizer, improved seeds, agrochemicals and veterinary drugs etc

j) Inadequate institutional support to livestock production systems in arid and semi arid areas.

k) Inadequate institutional support to the fishing industry including capture and aquaculture fisheries.

l) Increased frequency and severity of extreme weather such as floods and drought as a result of global warming and climate change, adversely affecting food production.

m) Inadequate flow of information on the adverse climate change impacts and actions to the producers

n) Prevalence of HIV/AIDS and other tropical human and animal trans boundary diseases that not only divert the already constrained resources from agricultural production but also waste the labour force.

o) Increased pressure on natural resources and degradation of environment due to rapid population growth, poor soil management practices, overgrazing etc.

p) High post harvest losses due to inadequate/lack of food storage and processing facilities.

q) Disruption of food production and distribution due to social unrest and political instability.

r) Inappropriate and low adoption of production methods due to inadequate research and extension services.

s) Inadequate food access particular among the vulnerable population/resources poor population.

t) Gender imbalances in access to opportunities in production, marketing and consumptions, access and control of productive resources.

2.0 THE CONTEXTS FOR EAC FOOD SECURITY ACTION PLAN

2.1 The East African Common Market Protocol as an Important Instrument of Ensuring Food Security in the Region

In the EAC region the food production, processing and preparation sector remains a key sector in the economies of the member states. It is estimated that between 70% to 80% of the labour force of the EAC is involved in the food sector in one way or another. Between 24% and 48% of the GDP of the member countries, is attributed to the agriculture sector. These figures may be an under-estimate because they often do not take into account of livestock, fisheries and other food supply systems.
The 2009 Economic Report on Africa (ERA, 2009)\(^1\), explicitly recognized the potential regional agricultural value chains supported by agribusiness and agro-processing as a basis for linking especially the smallholder producers to markets for food and other agricultural products. Therefore, the East African Common Market (EACM) provides the best opportunity for building such value chains, because it provides a framework for exploiting economies of scale in the production and supply of food.

The realization of a regional economic bloc encompassing five countries leading to a combined population of over 120 million, land area of 1.85 million km\(^2\) and a combined GDP of US$ 73 billion, is an opportunity for enhancing food security that should be used with all the priority it deserves.

### 2.2 The Need for Regional Policy and Standards for Food Security

The regional perspective required to accelerate food security in East Africa is currently seriously hampered by the frequent imposition of export bans even between districts within one country. This practice results in the separation of surplus food production zones from the deficit markets they would normally serve in both large cities and rural areas. A recent assessment report by the World Bank of maize marketing in East Africa\(^2\), revealed the following:

- Protectionist measures through export bans lead to lost opportunities for farmers and traders, who then reduces their investment in production in subsequent seasons leading to overall reduction in food production,
- Apart from reducing potential outputs, arbitrary bans on selling of cereals leads to reduction in quality, quantity and value, causing losses to the economy as a whole, and
- The export bans and other trade restrictions scare away private sector development and investments in the food sub-sector, leading to sluggish growth in the sub-sector, and lost opportunities for farmers and consumers.

The EAC is in the process of development, adoption and implementation of regional legal, regulatory and institutional framework for EAC SPS Protocol. The draft EAC SPS protocol was adopted by the last Sectoral Council on Agriculture and Food Security which was held on 2\(^{nd}\) December, 2009.

The principal objective of the EAC SPS Protocol is to adopt and enforce sanitary and phytosanitary measures in order to minimize their negative effects on trade. The Protocol elaborates rules for application, which relate to the use of sanitary and phytosanitary measures, and recognizes the rights of importing countries to implement these measures.

---

2.3 Critical Infrastructure Especially in the Rural Areas

The EAC in general and the member countries in particular are doing a commendable job at investment to build new, and upgrade infrastructure along the main transportation corridors. The EAC countries are leading the continent in playing its part in initiatives designed to interconnect the networks of the various countries as part of the development plans outlined by the African Union through the NEPAD Infrastructure Plan.

However, studies supported by Kilimo Trust (KT) and FAO in East Africa have shown that the missing link is in feeder roads and other market-facilitating infrastructure in the rural areas. Therefore, efforts in development of major corridors should be balanced with accelerated parallel investment on rural feeder roads, which have been shown to have a significantly higher impact on agricultural productivity, response to price signals by producers, and reduction of marketing costs.

Furthermore, rural roads connect the national and regional roads and railways to the production areas increasing the efficiency of consolidation of cargo for the large trucks and thus optimizing the utilization of the transportation infrastructure in general. Success of the EAC Food Security Action Plan will depend on efficient connectivity that will increase confidence of the producers on the market, so as to convince them that they can focus on their comparative advantage and produce surplus for the market, while depending on the same market to supply what they would like to consume but do not have the comparative advantage in producing it.

2.4 Development of Agro-industries for Value-addition Processing

The World Development Report 2008 called for an accelerated expansion of the share agro-industries in agricultural GDP as a way of making agriculture an engine of economic growth and reduction of poverty. This is because agro-industries create forward and backward linkages, leading to significant multiplier effects, generating demand for agricultural produce and associated inputs and services, creating on- and off- farm employment, enhancing incomes and contributing to value addition and increased public sector revenues. Through the development of agro-industries, access to markets, finance and technical assistance can be facilitated for smallholder producers, promoting their inclusion into modern and efficient value chains.

Value-adding agro-processing of food commodities increases food security in four major ways; namely:

i) Reduction of post-harvest losses which are currently estimated by several organizations (FAO, CIRAD, NRI and UNIDO) to be as high as 30% in cereals, 50% in roots and tubers, and up to 70% in fruits and vegetables;

ii) Extending the shelf-life of food, making most food especially perishables tradable and easier to move over long distances from areas with surplus to areas with deficits;

iii) Enhance incomes and creation of employment along the food chain from production to marketing; and

iv) Improving the quality and safety of foods through appropriate certification, traceability systems and harmonization of standards, thus improving access to markets.

Furthermore, expanded agro-industries will contribute to poverty reduction through combined effects of employment gains, income enhancement, inclusiveness and food security.

2.5 Development of Insurance Instruments

Agriculture in general and food supply in particular are faced by many risks, including:

- **Production Risk** – due to weather calamities such as drought and floods as well as pest, disease, fire and many other perils mainly impacting the primary producers;

- **Market or Price Risk** – caused by volatility of prices in which case in some years the prices received for primary produce and products may not cover basic costs of production;

- **Input Cost Risk** – the cost of inputs, impacted by the cost of raw materials, is variable and may be higher than the price received for the commodity produced;

- **Transaction Risk** – associated with receiving payment and/or the delivery of agriculture commodities within an international trading environment; and

- **Food Safety Risk** – associated with producing a safe food product (or perceived safe food product) for consumers.

However, temporal and spatial variability of climate, especially rainfall, is the major risk facing producers, agro-processors and consumers in EAC. Analysis of climatic data shows that the coefficient of variation of rainfall in semi-arid tropics can be as high as 50% and most of the annual rainfall often falls in few rainfall events within three to five months of the year. Evidence is emerging that climate change is making the variability more intense with increased frequency of extreme events such as drought and floods, which sometimes occur within one season in one location.

At regional and national levels, the consequences of climatic variability are a major cause of large economic losses such as destruction of infrastructure – for example, nearly 10,000 km of rural roads were destroyed in Uganda alone during the El Nino rains of 1997. At community and individual level these
disasters lead to death, loss of livelihoods, destruction of assets and thus increased vulnerability. In the EAC sub-region droughts following floods have been a major cause of famines affecting millions of people in the last 50 years.

A major drought affecting several parts of the EAC is recorded in at least every 10 years with amazing regularity. It is therefore important to understand, adapt and cope with climate variability so as to ensure food security.

Insurance is one of the means for mitigating the financial effects of risks associated with variability of weather and prices. Its main purpose is to provide monetary means of offsetting losses suffered by producers and other agro-entrepreneurs in the case of severe and catastrophic weather events such as drought and floods. If well applied, weather-indexed based insurance has several positive outcomes particularly important for the smallholders as well as the agricultural system that supports them:

i) Encourages investments by farmers in productivity-enhancing inputs leading to a better exploitation of GOOD seasons. Currently, to avoid the risk of losing their investment in inputs, most smallholders adopt strategies that work during poor seasons. This means that they do not reap the benefits from the more frequent normal and better rain seasons.

ii) Facilitates credit availability. Due to the risk associated with agricultural production, producers in general and smallholders in particular have historically been unable to access credit financing. The administrative cost of financing small, high risk loans has affectively precluded many smallholders from credit. With an insurance arrangement that will pay off part or the entire loan in case of severe drought, the chance of default is reduced and so credit recovery costs are also reduced. This reduction in administrative costs should encourage lenders to provide more credit to smallholder producers.

iii) Reduce the need for food aid and hand-outs. Since there is less dependence on these welfare-type programs, confidence will be built among smallholders in their ability to be self supporting. Furthermore, governments will have less pressure for providing food aid and similar type programs.

iv) Many markets require sufficient volume to justify the necessary infrastructure. Insurance may encourage the use of inputs or other cultural practices that enhance agricultural productivity. The increased volumes should lead to increased agri-business investments in the necessary marketing structures so the smallholder producer can access more market alternatives.

2.6 Food Access and Utilization

Self-sustaining domestic markets for food are non-existent in the rural areas due to lack of purchasing power. Most of the food is consumed by those who produce it, and most of the surplus production is left to go to
waste. Even the burgeoning urban areas are dominated by poor underemployed people with very little purchasing power to save as a significant “real” market. This is what leads to the “fallacy of composition” for producers venturing into adopting productivity-increasing technologies and practices, who find that they cannot recoup their investments. This is a poverty trap which unfortunately is perpetuated by intervention programmes that are solely focused on pushing inputs and extension to increase production and not income generation to increase/improve the purchasing power.

To overcome this problem, more investments are required in deliberate efforts to transform a proportion of smallholders from direct producers of food commodities, to entrepreneurs dealing with non-food and high value commodities, non-farm agricultural enterprises especially in the value-addition processing industries, and non-agricultural rural enterprises such as cultural tourism, forestry and services. The idea here is to create a genuinely thriving local and national market for food commodities and products so as to achieve locally-generated attractive returns to those who continue with food production enterprises. In summary, we need a change of gear from efforts to link food producers to distant and limited urban and overseas markets, to investing in creating and expanding the markets for food commodities at local levels.

The radical change of approach required is to link emergency food aid to long-term development. This is because trends show that while one part of a country or sub-region suffers from food shortage and is receiving food aid from developed countries, another part of the country or sub-region is forced to abandon bumper harvests to rot in the field for lack of a market. This kind of approach will increase the capital flow to help food producing households and communities build up their asset base to be able to effectively deal with their own emergences in the future.

### 2.7 Production and Productivity of Food in the EAC Region

In calling for African Green Revolution, H.E Kofi Anan once remarked that “the knowledge required for Sub-Saharan Africa to achieve its own green revolution is not lacking, what is lacking as ever, is the will to turn this knowledge into practice...” This was corroborated by the World Development Report, which estimated that the rate of use of improved varieties in SSA was about 24%, use of chemical fertilizer stood at only 13%, and use of appropriate water control systems for agriculture covered only 4% of the cultivated land.

Consequently, low yields are widespread. For example, the average grain yield in rain-fed farming is about 1 t/ha for smallholders, while under similar agro-climatic conditions, on-station yield levels of grain maize reach between 5-6 t/ha, and commercial farmers generally operate at much higher yields of 7-8 t/ha. In the dry areas, yields achieved by

---

4 HE Kofi Anan, MDG Technical Support Centre, 2004
smallholders average 0.5 t/ha. Yet, billions of US$ have been used for research by international, regional and national organizations to develop new varieties, agronomic and husbandry practices, and other technologies such as irrigation and processing. More importantly, there are a multitude of experiences, best practices and lessons that have been generated by farmers and other agro-entrepreneurs, as well as by many agricultural development programs. Most of these are not being adopted at scale.

The EAC region is endowed with ample land resources which to some extent are under-utilized for various reasons (Figure 1). One of the main characteristics of land use in the sub-region is the high concentration of people and livestock in highlands areas because of some high potential features such as long LGP, cooler climates and deep soils. At the same time there are vast stretches of land with good soils but under-utilized because of shortage of water. Opening up the underutilized lands will call for increased productivity of livestock systems as they are the most dominant and feasible systems in these areas.

The portions of land used in both the humid and semi-arid areas experience accelerated degradation through loss of vegetation cover and reduction of soil productive capacity from soil erosion, salinization and nutrient over-exploitation. More than 95% of crop production is by smallholder farmers mostly using low inputs. The intensive low-inputs systems accelerate the lowering of soil quality, in other words the capacity of soil to maintain productivity through plant growth and environmental health. Estimates made at continental level show that the rate of loss of nutrients from smallholder fields are in the range of 660 kg N ha-1, 75 kg P ha-1 and 450 kg K ha-1.

The Abuja Fertilizer Summit\(^5\) resolved that the African Union member states will accelerate the timely access of farmers to fertilizers so as to increase the level of use of fertilizer from the current average of 8 kilograms per hectare to an average of at least 50 kilograms per hectare by 2015. Some of the means suggested include:

- Reduce the cost of fertilizer procurement at national and regional levels.

\(^5\) http://www.africafertilizersummit.org/
• Developing and scaling up input dealers’ and community-based networks across rural areas.

• Granting, with the support of Africa’s Development Partners, targeted subsidies in favor of the fertilizer sector, with special attention to poor farmers.

• Accelerate investment in infrastructure, particularly transport, fiscal incentives, strengthening farmers’ organizations, and other measures to improve output market incentives.

• Establish Regional Fertilizer Procurement and Distribution Facilities through strategic public-private partnerships.

• Promote national/regional fertilizer production and intra-regional fertilizer trade to capture a bigger market and take advantage of economies of scale.

• Establish an Africa Fertilizer Development Financing Mechanism that will meet the financing requirements of the actions agreed upon by the Summit.

Water for agriculture: The supply of water is skewed both temporally and spatially. In most cases it is the temporal variations rather than amount of rain which brings most problems to rain fed systems. However, it is important to pay attention to rain fed crop and livestock systems as they currently supply more than 90% of the food consumed in the region. Even in the semi-arid areas there is plenty of rainwater but more than 60% often goes back to the atmosphere unutilized for any productive purposes. The main requirement is management interventions which enable beneficial plants to use effectively, through transpiration, the rainwater available on-farm.

The basic principles are simple and have been known for a long time; they are:

• Optimizing infiltration – the main purpose being to reduce non-productive depletion of the rainwater through evaporation and run-off, while reducing erosion and increasing re-charge of ground water

• Increasing the water-holding capacity of soil within the root zone – to make most of the captured water available to plants

• Ensuring an efficient water uptake (i.e. high ratio of transpiration/evapotranspiration) by beneficial plants – achieved through appropriate agronomic and husbandry practices

• Optimizing the productivity of water used by plants, in value of products – through the choice of crops with sufficient demand in accessible markets.

Irrigation development has focused most attention on civil engineering structures for water diversion rather than the management practices needed to optimize water use efficiency at field level. In most cases once a field is treated to meet the four principles above, irrigation may only be required as a strategic supplement to mitigate the effect of dry spells. But one would
ask, since the principles mentioned above are so simple why are they not widely adopted?

Most of the river flow in the region has not been mobilized such that the installed capacity for storage of water is on average 500 m$^3$ per capita. In the USA or Australia the installed water storage capacity is more than 5,000 m$^3$ per capita. Furthermore, out of the world’s 45,000 large dams, only 1,000 (2%) are in SSA and nearly all (600) in one country, South Africa. Large countries like Tanzania have less than five large dams.

The EAC region is also home to several lakes each with more than 25 km$^2$ surface area, including Lake Victoria and Lake Tanganyika, counted among large lakes in the world. Wetlands are critical ecosystems in the sub-region with the wetlands in highland countries such as Burundi, Rwanda and Uganda. Therefore, the EAC region has an economic water scarcity because of inadequate investments in water control structures and systems for effective management of water resources.

There is nothing that demonstrates the role of water control infrastructure, than the sheer scale of investment on such infrastructure by the rich countries. For example, in Japan, heavy investment in water control infrastructure since the 1970s has reduced annual economic losses due to floods from 20% of GNI, to less than 0.5%. In both the developed world and developing countries, investments on infrastructure to harness water for agriculture have led to tremendous positive impacts in the creation of wealth and improvement of food security. Furthermore, experience from both rich and developing country show that apart from securing water supply, infrastructure plays a major role in protecting people and their properties against the vagaries of floods and drought. It is estimated that in Tanzania, 70% of declared disasters are water related, 37% caused by floods and 33% caused by drought. Therefore, the lack or inadequate water control causes so much destruction to the economy and livelihood assets, such that a single event of meteorological drought in a 12-year period lowers the GDP by 7-10% and increases poverty by 12-15% on top of wiping out all the assets of majority of the poor.

Key issues on water resources in the EAC are:

- Improving the productivity of water at farm level through a strategic mix of enterprises, integrated Agricultural Water Management (AWM) approaches and water management technologies in both rainfed and irrigated agriculture,
- Enhancing economic benefits while containing environmental impacts at local, watershed, national or basin levels, as a result of increased use of innovations and technologies for enhancing the farm level productivity of water in the upper catchments,
- Improving incentive (such as trade) and governance mechanisms to bring about beneficial uses and management of water in the upper catchments while maintaining or improving water availability for downstream or eco-systems needs,
• Combining indigenous knowledge with cutting edge information technologies to develop the most appropriate decision support tools for different stakeholders (including individual resource users) to improve planning for sustainable use of water, and

• In-building adaptation to climate change in all agricultural and water development strategies and programmes.

One of the major contributors to food insecurity and poverty in the EAC is inadequate use of livestock assets. Figure 2 provides statistics assembled from different sources for the two main types of livestock, namely ruminants and poultry. These statistics show that the size of livestock asset in the region is estimated at 41 million cattle heads, 33 million goats, 14 million sheep, 900,000 camels, and 130 million poultry. There are also other livestock such as pigs (3 million). Statistics also show that bee-keeping is an important undertaking by the smallholders in East Africa.

To gauge the potential of the livestock sector in food security and reduction of poverty, there is a need to assess the extent to which the livestock assets, as depicted in Figure 2, are converted into income per year. Despite the large livestock population in the region, the production of different livestock products for the market, is very low (Tables 1 and 2). On average beef production is estimated as just below 800,000 MT. Off take from small ruminant livestock is estimated at an average of 130 MT which could be a gross under-estimation because majority of goats and sheep are consumed within the producing households. Similarly the estimated average production of 108 MT of poultry meat could be a gross under-estimation because majority of the poultry and poultry products are consumed within the producing households. However, the free-range poultry is one of the most important assets of rural poor households. Pig meat production in the EA region is estimated at 111 MT per annum of which about 70% is produced in Uganda. For hides and skins, available statistics show that 5.71 million pieces of hides and 12.31 million pieces of skins (goats and sheep) are produced annually in the EA region. These are equivalent to 129,070 MT.

Figure 1 (below) shows a rough estimate of the value of major livestock products harvested each year in the region. These estimates have been made using average world prices and it is estimated that these values could be realized in the city markets in East Africa. Given the size of wealth held in the form of livestock, it is frustrating that poverty is so widespread in livestock keeping areas (including agro-pastoral and pastoral areas with large livestock numbers). In Tanzania, for example, agro-pastoral and pastoral areas account for 95% of the cattle population, yet most agro-pastoral and pastoral households live below the poverty line of US$ 1 per day (Mdoe et al., 1998).

Figure 1: Estimated annual value of selected livestock products total for the EAC at world prices

The above evidence provide for the cause of EAC becoming an Important Exporter of Food Products to Exploit Global Markets for Food.
3. **PRIORITY AREAS FOR THE EAC FOOD SECURITY ACTION PLAN**

3.1 **Provision of Enabling Policy, Legal and Institutional Framework**
- To create a harmonized approach for enhancement of food security in the East African region.

3.2 **Increase Food Availability in Sufficient Quantity and Quality**
- To increase agricultural (crops, Livestock and Fisheries) productivity and make East Africa Region a net exporter of food.
- Ensure that food is effectively moved from areas of surplus to areas of deficit within the East Africa region.
- To deliberately improve exploitation of alternative sources of food supply from crop, livestock, marine and fisheries, and forestry systems.

3.3 **Improve Access to Food**
- Improve Physical Access to Food.
- Put in place structured trading system for food commodities and products.
- To improve food purchasing power of Individuals, households and communities.

3.4 **Improve Stability of food supply and access in the EAC Region**
- To improve capacity for emergency preparedness and response.

3.5 **Enhance the efficiency of food utilization, nutrition, and food safety**
- To Improve on nutrition and food safety.

3.6 **Implementation Strategy and Monitoring**

3.7 **Resource Mobilization and Time Frame**
Financial resource will be mobilized mainly from EAC Partner States and Development Partners. The Plan will cover a period of 5 years from 2010 to 2015.

**As a cross cutting issue, all food security strategies and actions will have in-built gender and HIV/AIDS considerations.**
### 4. DETAILED ACTION PLANS

#### 4.1 PROVISION OF ENABLING POLICY, LEGAL AND INSTITUTIONAL FRAMEWORK

**Objective 1: To create a harmonized approach for enhancement of food security in the East African region**

**Grand Total USD 43.11 Billion**

NOTE: Estimated cost in the action plan is based on the projections of the current national expenditure and anticipated activities extracted from Partner States national budgets.
4.6 IMPLEMENTATION STRATEGY AND MONITORING

4.6.1 Implementation and Coordination

The Plan shall be implemented over a period of 5 years, from 2010 to 2015 and the Sectoral Council of Ministers Responsible for Agriculture and Food Security will guide its implementation. For its effective and efficient implementation, it will be necessary to strengthen the capacity of the EAC Secretariat to coordinate the implementation of the joint programmes and projects emanating from this plan.

At the Partner States level, Ministries responsible for Agriculture, Food Security, and respective Sector Ministries will be charged with implementation of the Plan. An Inter-Ministerial Coordination Team comprising Agriculture Sector and relevant sector Ministries will be established, where they don’t exist, for close supervision. This may include stakeholders, active NGOs and Private Sector in the relevant fields.

4.6.2 Monitoring and Evaluation (M & E)

In order to effectively monitor the implementation of EAC Food Security action Plan, a common monitoring system will be used. The EAC Secretariat will prepare a monitoring master plan with clear indicators. The EAC Secretariat will be responsible for monitoring the implementation of the Plan at Community level. Partner States will be responsible for monitoring the programs that fall within their territories. The projects and programmes under this plan will be monitored and reports submitted semi-annually.

4.7 RESOURCE MOBILIZATION

The Plan will be financed with resources from a number of sources including, EAC Partner States, Development Partners, International funds, Climate Change adaptation fund, the Private Sector Investors, and financial institutions such as Commercial Banks, Development Finance Institutions (DFIs) and Micro-finance facilities. A financial resource mobilization plan will be prepared by EAC Secretariat in collaboration with Partner States to attract funds to implement this plan.

The EAC Secretariat in collaboration with Partner States will draw up a detailed annual work plan indicating financial requirements based on objectives identified in the Action Plan. The implementation of the plan will be phased starting with the crucial strategic interventions. The plans will be financed by the Community, Development Partners and investors. However, it should be reiterated that for the EAC region to overcome its current food security problems Partner States will have to make substantial investment in the agriculture sector development at national level, as regional interventions can only succeed if national strategies are
successfully implemented. Towards this, Partner States should commit a substantial proportion of the financial requirements for implementing the Plan in their national budgets and mobilizing additional funds from development partners and other sources.
